Python Machine Learning In Biology:
Python Foundations

Nichole Bennett

No matter where you are now, you'll be fine.

You have already proven that you are a self-starter and self-learner, and that will take you far.

What is Python?

What is Python?

Created by Guido Van Rossum in 1991

Easy language to learn

Lots of contributors to modules

Emphasizes human readability

What is an interpreted language?

Python is an interpreted language

Code doesn't have to be translated into machine-language before execution (VS compiled code that is executed by the computer's CPU)

This means it's not as fast as compiled code
But also means it's more portable

What is an object-oriented language?

Python is an Object-Oriented language

Instead of just being a series of actions, Python lets us form "objects" that have their own data (attributes) and their own actions (methods) to modify their data.

A benefit of OO is that it is easier to reuse the code in other programs.

We'll be using lots of objects. (We may not even realize it).

Car class

Car Objects

Green	Red	Blue
Ford	Toyota	Volkswagon
Mustang	Prius	Golf
Gasoline	Electricty	Deisel

What is a "high-level" language?

Python is a high-level language

```python
print("hello world")
```
Python

```cpp
#include<iostream>
using namespace std;

int main()
{
    cout << "Hello World!";
    return 0;
}
```
C++

What is a dynamically-typed language?

Python is a dynamically-typed language

This means you don't have to specify what type the variables are. The computer figures it out for you

Why use Python?

Why use Python?

Quick and easy to use

Big community with lots of "batteries included" libraries (especially for machine learning)

Most libraries written by people with a computer science background, so easy to switch from library to library

Why not use Python?

Why not use Python?

If you have something that needs speed

If you are doing lots of stats

Python Interactive Shells

Write code that is executed immediately by the Python interpreter.
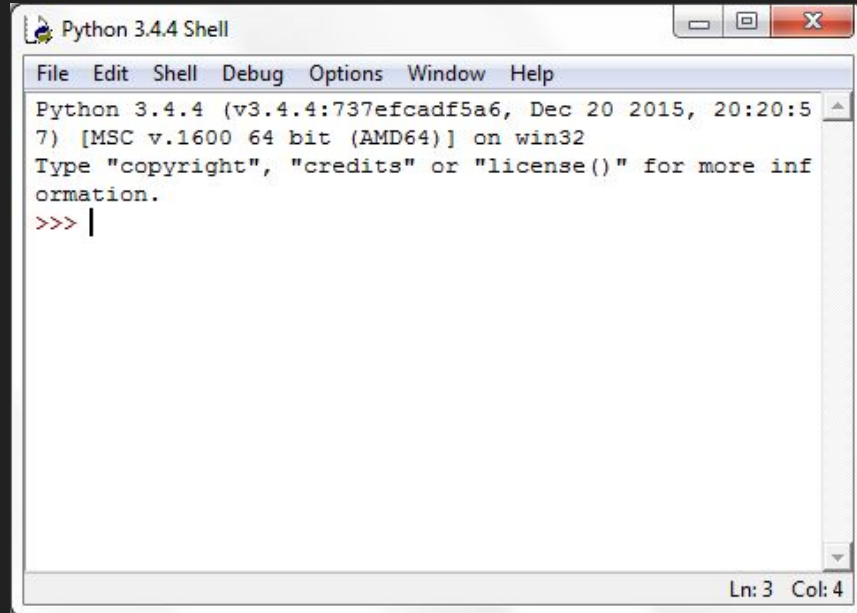

We are able to "interact" with the results of the commands we pass. We can do this using a:

- Python shell
- iPython shell
- Jupyter notebook

Python Shell

A python shell is similar to a Command Line Terminal and it can be launched by typing (into Terminal or Git Bash)

`python`

iPython Shell

iPython provides syntax coloring and shortcuts to interact with other code.

You can launch it by typing (into Terminal or Git Bash)
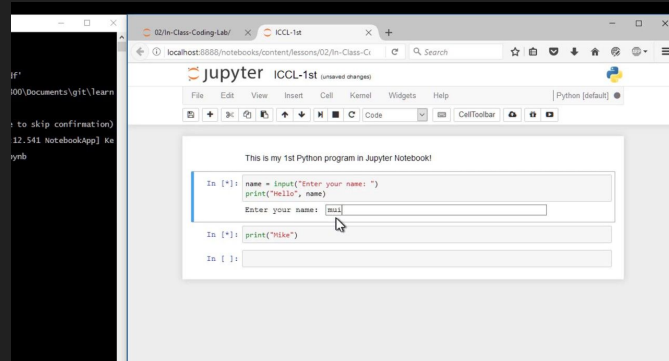

`ipython`

Jupyter Notebook

A Jupyter notebook is a web interface. With it we can use formatting and markdown with our code. This is what we'll be primarily using for this course.

Mac/Linux: In the terminal type `jupyter notebook`

Windows: Click the "Start" button and type "cmd" type `jupyter notebook`

Or open Git Bash and type `jupyter notebook`

Jupyter Notebooks

born out of the IPython project--grew to encompass more languages

The name Jupyter is an indirect acronym of the three core languages it was designed for: JUlia, PYThon, and R

Scripting

Sometimes we just want to execute a program and get results, not interact with our Python code.

In those cases, we use a Python script.

To do so, we can use a text editor of our choice and save the code in a file with extension ".py".
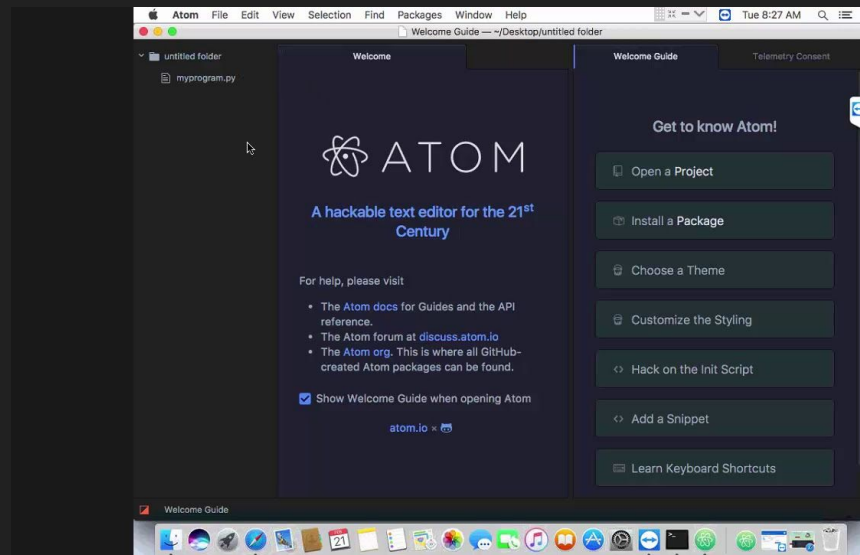

Text Editors

Some common plain text editors include:

Atom

NotePad (Win), NotePad++ (Win)

TextEdit (Mac), TextWrangler (Mac).

Nano (Linux, Mac)

IDEs

Integrated development environments (IDEs) provide tools for writing and testing your software (Brings tools together for you)

PyCharm

Eclipse with PyDev

Atom

Spyder (included in Anaconda)

Introduction to Jupyter Notebooks

Opening a Jupyter Notebook from
Git Bash (Windows) or the Terminal (Mac)

```
Nicholes-MacBook-Air:~ nicholebennett$ jupyter notebook
```

```

Headers, and markdown, and code (oh my!)

Keyboard shortcuts

Go to Help > Keyboard Shortcuts (or Cmd + Shift + P/Ctrl + Shift + P)

Some useful ones:

- `Esc` will take you into command mode where you can navigate around your notebook with arrow keys....While in command mode:
  - A to insert a new cell above the current cell, B to insert a new cell below.
  - M to change the current cell to Markdown, Y to change it back to code
  - D + D (press the key twice) to delete the current cell
- `Enter` will take you from command mode back into edit mode for the cell.

Keyboard shortcuts

Go to Help > Keyboard Shortcuts (or Cmd + Shift + P/Ctrl + Shift + P)

Some useful ones:

- `Shift + Tab` will show you the Docstring (documentation) for the the object you have just typed in a code cell
  - keep pressing this short cut to cycle through a few modes of documentation.
- `Ctrl + Shift + -` will split the current cell into two from where your cursor is.
- `Esc + F` Find and replace on your code but not the outputs.

Keyboard Shortcuts

Go to Help > Keyboard Shortcuts (or Cmd + Shift + P/Ctrl + Shift + P)

Some useful ones:

- Select Multiple Cells:
  - `Shift + J` or `Shift + Down` selects the next sell in a downwards direction. You can also select sells in an upwards direction by using Shift + K or Shift + Up.
  - Once cells are selected, you can then delete / copy / cut / paste / run them as a batch. This is helpful when you need to move parts of a notebook.
  - You can also use Shift + M to merge multiple cells.

Jupyter Notebook Demo

Jupyter Notebook Obstacle Course

1. Open a new notebook

2. Name the file something specific and useful

3. Add a header for your name

4. Add a code cell

5. Print a short sentence about yourself

6. Add some markdown

7. Explore!

CTRL + C to close out of the Jupyter Notebook from the Terminal or Git Bash

Getting Help

`Help` menu has documentation for some common libraries

Place ? before a library, method, or variable for a quick syntax reference

You can execute shell commands in notebooks by prepending the command with !

SECTION

Welcome to Colaboratory!

Colaboratory is a free Jupyter notebook environment that requires no setup and runs entirely in the cloud. See

Getting Started

- Overview of Colaboratory
- Loading and saving data: Local files, Drive, Sheets, Google Cloud Storage
- Importing libraries and installing dependencies
- Using Google Cloud BigQuery
- Forms, Charts, Markdown, & Widgets
- TensorFlow with GPU
- TensorFlow with TPU
- Machine Learning Crash Course: Intro to Pandas & First Steps with TensorFlow
- Using Colab with GitHub

IRuby: Notebook

An IJulia Preview

This notebook is a preview demo of IJulia: a Julia-language backend combined with the IPython interactive environment. This combination allows you to interact with the Julia language using IPython's powerful graphical notebook, which combines code, formatted text, math, and multimedia in a single document.

julia

- Note: this is a preview, because it relies on pre-release bleeding-edge versions of Julia, IPython, and several Julia packages, as explained on the IJulia github page, and functionality is evolving rapidly. We hope to have a more polished release soon.

Basic Julia interaction

Self-Diagnosis: Comfort With Python

Line up according to how well you think you'd be able to teach Python basics to someone else (e.g. functions, for loops, if/else, lists, dictionaries…)

Then:

Mob Coding (5 groups of 3) on Part 1 and 2
    1 driver, 1 navigator, 1 thinker
    Goal is to get every member of the group to understand

Then:

Do Python Foundations Practice on your own.
